ABSTRACT

The vocabulary content and reading difficulty levels of 47 texts required in 15 Newfoundland vocational training programs were investigated. Word frequency lists for each of the 15 programs were generated from samples of text, using computer technology. These lists are presented in appendix B, in both alphabetic and frequency listings. A combined, merged frequency list which includes all of the vocabulary entries is available on computer diskette, but was too bulky to include in this study in printed form.

The readability level of each of the texts was measured using the Fry Graph. Text readability levels were compared to the entry requirements (grade levels) for the fifteen programs. It was found that reading requirements for several of the vocational training programs were much higher than was indicated by the grade-level required for program entry. The word lists were compiled as instructional tools for educators and writers interested in preparing students who have poor reading skills for entry into vocational training programs. The comparison of entry level requirements and levels of text difficulty for each vocational program is presented for the use of those involved in counselling and placement of students.

ACKNOWLEDGEMENTS

I am deeply indebted to many people who helped me complete this work -- to Dr. Frank Wolfe and Mr. Noel Veitch, for their patience and guidance, to Dr. Fred Aldrich for the Dean of Graduate Studies Fellowship, and to Mr. Greg Bennett and Miss Barbara Veitch of Memorial University Computing Services. I would also like to thank my sister Margaret, my daughter Karen, my son David, and my many students and friends in Adult Education. Most of all I am grateful to Don for his love and support.

CHAPTER I

THE PROBLEM

Introduction

In Newfoundland, and in all of Canada, concern for the plight of the non-reader and the poor reader appears to be growing. The Royal Commission on Employment and Unemployment (1986) has suggested that the schools are out of touch with the needs of Newfoundlanders, especially those living in rural areas. The Commission found that because school curricula do not reflect the realities of life for many Newfoundlanders, students may become alienated and drop out early. The Royal Commission suggested that a curriculum must reflect a combination of the ideals toward which the society aims, and the realities of the people in the programs.

A percentage of those who leave school before graduation return to adult education programs to upgrade their education in order to qualify for vocational training programs.

Prior to this study, this writer undertook a survey of present and former students in one Newfoundland literacy and

adult education center. This survey revealed that most of the students wanted jobs or hoped to enter vocational training which would lead to jobs. Thirty-four students were interviewed and were given a questionnaire. Over 82% of the students (28 out of 34) stated that the main reason they returned to school was that they had a vocational goal (Clark, 1985).

These students saw work as the primary reason for extending their education. However, at present, the Adult Basic Education (ABE) and literacy programs used in Newfoundland do not reflect this strong career goal. Teachers, program developers, counsellors and writers of materials designed for adult education appear to lack information about the requirements their students will face at the next stage of their educational experience in vocational training. A vocational training program may present the most stringent reading demands that a student will encounter in his entire career.

This writer has been a coordinator and instructor in one of Newfoundland's adult education centers for the past eight years. Former students who entered vocational training programs said that they had struggled with reading and mathematics materials. Present literacy and adult basic education programs might prepare students more effectively for future educational experiences if teachers and counsellors had a better grasp of the problems and

challenges which exist in vocational training programs.

Interviews with guidance counsellors at the Cabot Institute and at the Marine Institute indicated that they had no information about the reading difficulty of texts used in the vocational training programs offered in their schools. They also said that new students entering their programs were given no screening tests for reading or mathematics. The only factor they used in placing students in programs was the highest grade level which the student had completed.

Counsellors for Canada Manpower confirmed that they also use the highest grade level completed in placing students in vocational programs, and that they had no idea what the reading or mathematic requirements were in the various programs.

This practice of relying on the highest grade a student has completed may not be the most effective way to match students to programs. The highest grade a student has completed is not necessarily representative of either his reading and mathematical abilities or of the demands of the vocational program. Another problem is that the grade level required for entry to a vocational training program may not reflect the difficulty of its reading materials. These two factors could combine in such a way that a student who meets the grade level entry requirement could be required to read texts which are as much as six reading levels above his

level of reading ability. Some of this writer's adult education students have gone on to vocational training programs. They have stated that although they had the required entry grade they found problems in reading the vocational materials.

Statement of the Problem

Many students in Newfoundland literacy, Adult Basic Education and English as a second language programs have as their primary goal the getting of a job. When they are accepted in vocational training programs leading to certification in a particular trade, some students encounter difficulties in understanding both the printed materials and the mathematics related to that trade. Present literacy and Adult Basic Education programs do not address this strong vocational focus.

The Purpose of the Study

The purpose of this study was to investigate the reading requirements of textual materials required in Newfoundland vocational training programs.

A review of the literature, teaching experience, and common sense all emphasized that vocabulary knowledge is fundamental to success in reading, and therefore is also fundamental to success in training programs which require reading. There has been very little research conducted in the area of "functional literacy" which has attempted to identify specific reading tasks and strategies that individuals must be able to master in order to succeed in work and vocational training settings.

Adult Basic Education and English as a second language programs draw their materials from sources originally intended for children or high school students. Relevant materials specific to vocations and vocational training programs have been lacking.

The purpose of this study was:

1. to examine the reading materials (texts) required in vocational training programs.
2. to determine the readability (reading difficulty levels) of the texts required for each selected vocational training program.
3. to compare the readability of the texts for each vocational program to the grade level required for entry into that program, in order to determine if there are strong discrepancies between the two

measures.

4. to investigate the vocabulary content of the vocational texts required in each of the vocational programs, by generating word frequency lists from samples of texts. The lists are to be generated using techniques adopted from the work of word list researchers.

The word frequency lists compiled for this study are offered as possible aids to teachers and writers of materials for adult education, literacy, and English as a second language programs.

The readability data are presented in Chapter IV. An annotated bibliography of the 47 texts required in the 15 selected vocational training programs is presented in Appendix A.

The word lists for the 15 vocational training programs are presented in Appendix B, in both alphabetical order and in order of descending frequency.

A larger merged list, compiled from the samples of text from all fifteen vocational programs is available on computer diskette, but was too bulky to include in this study.

The word lists generated for this study may be a useful supplement to present adult literacy, Adult Basic Education (ABE), and English as a Second Language programs. The lists are offered as a resource for adult education and vocational teachers who are undertaking vocabulary development efforts,

and for writers of materials for literacy and adult education. It is possible that such vocabulary lists might be of use in the development of self-paced vocabulary development materials, either in printed or in computerized form.

The larger merged word list may contribute to the development of a core vocabulary for literacy programs. Present vocabulary lists used as a foundation for literacy programs lack a vocational component.

The information on readability of texts may be of use to guidance counsellors and teachers in high schools, adult education centers, and vocational training institutions.

Limitations of the Study

This study has many limitations which may not allow generalization to areas beyond Newfoundland. The small sample of adult education students who were interviewed to establish a need for the study was drawn from only one adult education centre in Newfoundland. Although similar value systems may be shared by other students in adult education across Newfoundland and across Canada, this has not been ascertained.

Texts used in vocational training programs are subject to change. However, many vocabulary items specific to a content field may remain fairly stable over time. In order to ensure that information of this kind is truly representative of the textual materials in use, a continuous monitoring of changes would be required.

The texts sampled do not represent a subset of Newfoundland oral language. The text samples are representative only of the language which is in the texts, and a great number of those texts were published in the United States.

Readability analysis offers only a rough prediction of the degree to which a reader may succeed in understanding a text. Readability scaling allows texts to be grouped by reading difficulty. In a general sense it is possible to communicate differences between "easy" and "difficult"

passages and materials.

The accuracy with which the word lists generated for this study represent the vocabulary content of texts is limited by the size of the samples. It was not intended to generate lists based on the total word content of the texts. Such an analysis was beyond the capability of Memorial University's computer system, and too ambitious a project for the present study. The word lists are only as accurate as sample sizes permit.

Organization of the Thesis

This chapter has presented the purpose of the study, the significance of the study, and the limitations of the study.

Chapter II includes a review of relevant literature.

The methodology for this study is given in Chapter III. It explains the selection of the vocational training programs included in the study, and presents the background and rationale for the sampling decisions and definitions which were employed.

Chapter IV presents the major findings of the study in discussion and in tabular form.

Chapter V summarizes the study, offers suggestions for uses of the information presented, and makes recommendations for further research.

CHAPTER II

REVIEW OF RELATED LITERATURE

Introduction

The review of literature for this study encompassed several separate but closely related areas. Studies regarding the nature and definition of literacy, functional literacy, and job literacy are linked to findings in reading research. The review of reading research included studies of the process of reading, reading comprehension, and vocabulary. Readability studies and word list research are integrated with the findings of literacy and reading research, developing the background and rationale for this study.

The Concept of Literacy

The concept of literacy is an ideal which continues to change as it is reshaped by the societal, political, cultural and economic influences active within each community and each historic period (Cook, 1977; D.P. Resnick & L.B. Resnick, 1977, in Wolf, et al., 1979; Diehl, 1979; Oxenham, 1980; Hunter & Hafman, 1979; Havelock, 1976; Johansson, 1973; and Kirsch & Guthrie, 1977).

An historical analysis of the nature of literacy by Resnick and Resnick (1977, in Wolf et al., 1979) revealed "a sharp shift" in literacy expectations held for the general population. Resnick and Resnick found that the high literacy expectations once held for only a few elite members of society are now held for all members. "We think that this nation [the United States] perceives itself as having an unacceptable literacy level because it is applying a criterion that requires, at a minimum, the reading of new material and the gleaning of new information from that material" (Resnick & Resnick, 1977, in Wolf et al., 1979, p. 397).

Resnick and Resnick (1977, in Wolf et al., 1979) suggested that the present alarm raised over the literacy shortcomings in contemporary North American society may be a function of rapidly increasing expectations.

Much of our present difficulty in meeting the literacy standard we are setting for ourselves can be attributed to the relatively rapid extension to large populations of educational criteria that were once applied to only a limited elite. The result of this rapid extension is that instructional methods suitable to large and diverse populations rather than small and selected ones have not yet been fully developed or applied. Further, not all segments of our population have come to demand literacy skills of the kind that educators, members of Congress, and other government officials think necessary. (p. 397)

Resnick and Resnick (1977, in Wolf, et al., 1979) reported that expectations of high literacy levels for the entire population had appeared only after a long period in which there was no expectation of literacy for the general population. They suggested that for the larger population, even modest gains in the area of "functional literacy" would be a step forward.

Today, the term "functional literacy" has come to mean the ability to read common texts such as newspapers and manuals, and to use the information gained, usually to secure employment. The objectives of functional literacy seem limited, yet this mass-literacy criterion is stronger than that of any earlier period of history. Achieving universal literacy as it is now defined poses a challenge not previously faced. (p. 409)

The Problem of Definition

Any discussion of "literacy" soon focuses on the problem of definition. Most literacy research to date consists of attempts to describe the dimensions of the term.

In the early 1950s the United Nations Educational, Scientific and Cultural Organization's (UNESCO'S) Expert Committee on the Standardization of Educational Statistics proposed that: "A person is literate who can, with understanding, both read and write a short, simple statement on his everyday life" (Harman, 1970, p. 266).

Ten years later, UNESCO refined the statement to read: "A person is literate when he has acquired the essential knowledges and skills which enable him to engage in all

those activities in which literacy is required for effective functioning in his group and community" (Harman, 1970, p: 227).

In their Report of the Committee on Reading, Carroll and Chall (1975) stated

The problem of literacy in the United States is one of ensuring that every person arriving at adulthood will be able to read and understand the whole spectrum of printed materials that one is likely to encounter in daily life.... In terms of grade levels of difficulty, a meaningful goal would be the attainment of twelfth-grade literacy by all adults -- roughly the ability to read with understanding nearly all the material printed in a magazine like Newsweek.... The educational ideal, at any rate, should be to bring each individual up to his maximal level of attainment. (p. 8)

Thomas (1983) suggested that the term "literacy" referred to a number of different skills and knowledge areas which might best be ranged on a continuum, from: 1) basic literacy, (the ability to use reading and writing for very simple tasks), 2) functional literacy, (which can mean different things to different groups throughout the world, and is tied to skills necessary for survival in a given milieu), and 3) functional competency (which ties functional literacy skills and knowledge to the successful accomplishment of life tasks), to 4) humane literacy: "the ability to read with comprehension and judgement the words of the best practitioners of the language, philosophers and poets in all their guises," and 5) technical literacies (which suggest a wide number of competencies in particular

technical fields such as mathematical literacy, scientific literacy, computer literacy, environmental literacy, etc. (p.18).

Carroll and Chall (1975) found that the attempt to pinpoint a definition of "literacy" was frustrating and really impossible.

Every commission or investigating body that has been charged with defining the extent of the literacy problem has been confronted with the fact that there is no generally accepted definition of functional literacy and that statistics on literacy are generally based on unsatisfactory data and criteria. The figures given in some sources concerning rates of literacy in various sectors of the population are generally not comparable. Statistics for the "literacy" rates of foreign countries as compared with the United States are well-nigh uninterpretable, because they are nearly always based on people's own reports or upon indirect estimates derived from information on years of schooling. (p. 7)

In an assessment of the U.S. Right to Read program, Harman (1970) found that there was every indication that the illiteracy situation was more severe than realized; gaps between readers and non-readers were widening. A major problem was the "lack of clarity regarding the shape and character of the goal itself -- what should constitute reading in the United States on the eve of the twenty-first century" (p. 3).

Harman (1970) noted the relativity of literacy expectations from place to place, and the continuing

escalation of expectations

What is commonly referred to as a reading level bears only incidental relation to the actual act of reading -- of deciphering a code of letters into meaningful words and phrases. Rather, reading level related more directly to the comprehension of what is read. Clearly comprehension is associated with one's experience, environment and interests. Social cultural and economic realities combine to form a context to which comprehension is bound. The combination of these factors already highly sophisticated in American experience -- never plateaus; it constantly agitates to reach new heights and forever seeks new peaks....these variables are inexorably intertwined with the unique situation of each and every country's socio-economic and cultural ambience. Levels of literacy -- of comprehension -- that would suffice to make a person literate in one area of the world would transform him into a functional illiterate in another. It is for this reason that there cannot be a universal definition of literacy, that the only valid determinations are those derived from the specific character of each nation. (p. 6)

Hunter and Harman (1979) identified two factors that make the concept of literacy elusive

First, as a society becomes more complex in both its technology and social institutions, expectations about the skills needed for participation in the society are also raised. Second, concepts of literacy have been extended during recent decades to include far more than conventional reading and writing. Emphasis has been placed on the uses of literacy that enable persons to function competently in their daily lives. [We conclude that]...concepts of literacy will likely always be dynamic and differ both among societies and among diverse subgroups within a given society. (p. 109).

Harman (1970) stressed that reading is not in and of itself an objective. "The real aim is that of social participation. Reading is a tool one needs for its attainment" (p. 6).

Our study leads us to believe that all definitions of literacy or illiteracy are completely relative. We tie the terms, therefore to social aspirations and functional criteria. Our definitions place the burden of describing levels and needs skills on the individuals concerned and on the social groups to which they belong. (p. 7)

Hunter and Harman (1979), Kirsch and Guthrie (1977), and Thomas (1983), all drew distinctions between conventional literacy and functional literacy.

Hunter and Harman proposed the following definitions:

1. Conventional Literacy: the ability to read, write, and comprehend texts on familiar subjects and to understand whatever signs, labels, instructions and directions are necessary to get along within one's environment.
2. Functional literacy: the possession of skills perceived as necessary by particular persons and groups to fulfill their own self-determined objectives as family and community members, citizens, consumers, job-holders, and members of social, religious, or other associations of their choosing. This includes the ability to obtain information they want and to use that information for their own and others' well-being; the ability to read and write adequately to satisfy the requirements they set for themselves as being important for their own lives; the ability to deal positively with demands made on them by society; and the ability to solve the problems they face in their daily lives. (Hunter and

Harman, 1979, p. 8)

Bormuth (1975) maintained that unless it was possible to describe the parameters of what was meant by "literacy" or "functional literacy", "...it is impossible to put much faith in...any literacy statistics currently available" (p. 621).

Bormuth (1975) defined literacy as "the ability to exhibit all of the behaviors a person needs in order to respond appropriately in all possible reading tasks. Furthermore, a person may be regarded as literate only with respect to a particular reading task" (p. 65).

Bormuth (1975) proposed that any definition of literacy for a specific purpose must encompass both the reading ability of the individual, and the readability of the materials to be read. He used the term "literate" to describe the ability to respond competently to real-world reading tasks. Bormuth emphasized the relationship between reading skills and the level of difficulty of print, pointing out that, depending on the materials, any number of people could be branded literate or illiterate. He also argued that instead of holding the print fixed, the difficulty level of reading materials could be altered, making more people "literate".

Functional Literacy

The U.S. Army coined the term "functional literacy" during World War II. It meant the capability to understand written instructions necessary for conducting basic military functions and tasks. A service man at the fifth-grade reading level was considered to be functionally literate (Sharon, 1973, p. 148).

Kirsch and Guthrie (1977) pointed out that since World War II the term "functional literacy" has come to mean the competency to perform tasks thought necessary to adequate adult functioning. "While currently there is no universal agreement on a definition of functional literacy, informed sources emphasize adequate performance on reading tasks directly related to real world experiences" (p. 488).

Kirsch and Guthrie suggested that the term "functional literacy" related to levels of skills that individuals or populations needed in order to complete some specified real-life reading task. They defined functional literacy as:

reading (comprehending printed materials) to obtain, retain or maximize an end or goal which has survival value. A possible measure for determining the degree of utility for "survival" is the percentage of persons who engage in the reading task as a means to some goal rather than as a goal itself. (p. 490)

Kirsch and Guthrie drew a distinction between "functional literacy" and "functional competency". However, they pointed out that Sticht et al. (1972) had discovered moderately high correlations between standardized reading

tests and functional tests. Sticht's research indicated that the two tests measured much the same thing.

Functional literacy is not determined solely by the skills an individual or group acquires. It is a continuous process of applying specified skills to specified tasks. Assessing these skills, once they have been identified, is a measurement problem involving the identification of meaningful tasks. It seems...appropriate to represent functional literacy as continuously distributed, with various points along the continuum indicating different levels of functioning. (Kirsch & Guthrie, 1977, p. 492)

It was not until the late 1960s that comprehensive research efforts were undertaken at the national level in the United States and Canada, to identify actual literacy skills and strategies needed by a person to "survive", "cope", "participate", or "thrive" in society. In the early 1970s the United States Office of Education supported several studies directed toward discovering the parameters of "literacy", and "functional literacy". These studies included: 1) the Survival Literacy Study (Louis Harris and Associates, 1970); 2) the Mini-Assessment of Functional Literacy (MAFL, Gadway and Wilson, 1974), conducted by the National Assessment of Educational Progress, 3) The Adult Functional Reading Study, (Murphy, 1975), which was preceded by a survey to determine what Americans read, Sharon (1973), 4) the Adult Performance Level Project (Northcutt, 1975), and 5) Project REALISTIC, (Sticht et al., 1971; 1972; 1975; 1977; 1978).

These studies attempted to identify the skills, tasks, knowledge areas and reading materials which a person needed to master in order to be considered "functionally literate" or "functionally competent". Although these studies have been criticized on the basis of design, and on the basis that they lacked clearly stated rationale for the criteria they specified, they approached the problem inductively, by attempting to identify specific factors comprising "literacy".

In studies for the United States National Reading Council (1970) and for the National Reading Center (1971), Harris and Associates compiled an instrument of 59 "survival" items based on application forms, income tax forms, instructions for dialing long distance, classified housing ads, classified employment ads, personal identification, employment, income, housing and automobile categories. After testing samples of the United States' population, Harris et al. concluded that 15 to 20 million adults in the United States were impaired in their ability to respond to print in real life situations. The goal of the Harris study was to determine the "percentage of Americans lacking the functional or practical reading skills necessary to 'survive' in this country" (Kirsch and Guthrie, 1977, p. 496). This study was the first study of adult literacy to place individuals on a continuum, instead of in one of two categories, i.e., "literate" or

"illiterate" (Kirsch and Guthrie, 1977, p. 496).

A survey by the Educational Testing Service (Murphy, 1975) attempted to identify the materials the national population read, to determine how important members of the population judged those materials to be, and how well they were able to read them.

According to Murphy (1975)

it was assumed that a significant literature existed which documents the reading ability of various sub-populations as a function of sex, age, race, socio-economic status, etc., and that various standards of reporting utilized in this literature could be related to individuals and social needs. In the actual review process, the project staff found that this assumption was not met. (p. 6)

Gephart (1975) reported that

Many statements have been made which assert that our society has a reading problem. These assertions have been made with sufficient authority and frequency that they have been accepted as fact: a reading problem exists. What is the desirable level of competence to be achieved by the individual in our society? Even more basically, what level of reading competence is necessary to function in our culture? Neither of these questions has been answered on either an empirical or logical basis. Reading and reading achievement have been the target of measurement efforts over the years, but the data do not answer the two questions cited above. (Gephart, in Murphy, 1975, p. 6)

Murphy (1975) also found a lack of information:

There exists neither a good estimate of the reading ability necessary to function satisfactorily in modern society nor a satisfactory estimate of the absolute reading achievement of reasonably defined sub-groups in the United States. (Murphy, 1975, p. 18)

Hunter and Harman (1977) suggested that it was not possible to define functional literacy for a wide population, and it might be a mistake to try to do so.

The basic question may be: Whose needs are served by generalized statistics about the population? We agree with Sylvia Scribner of the National Institute of Education and Michael Cole of Rockefeller University when they conclude, in their studies of the ethnography of literacy among the Vai people of Liberia that, 'While attempts to arrive at some overall measures of literacy competencies may be useful for certain comparative purposes, the representation of literacy as a fixed inventory of skills that can be assessed outside of their contexts of application has little utility for educational policies.' (p. 19)

A lack of clear and valid criteria seems to have plagued not only attempts to survey the population, but also to test it. A survey of Buros' Mental Measurement Yearbook (1975) produced a list of several "literacy," "functional literacy," and "vocational competency" tests, but upon close inspection, the tests lacked clearly stated criteria. Tests designed to have face validity for adults required further validation.

A small number of studies have made specific contributions toward identifying the parameters of functional literacy. The Adult Functional Reading Study (Murphy, 1975) and Sharon's (1973) investigations of what

printed materials Americans read, were early efforts to determine what reading tasks could be considered to be "representative" tasks with respect to the general population of the United States. Tasks were selected (no criteria specified for selection) and administered to approximately 8,000 adults. One important finding was that reading materials at work is a critical reading activity. Murphy and Sharon found that although simple reading tasks could be carried out by most adults, there were significant differences among groups of adults (Murphy, 1975; Sharon, 1973).

Negin and Krugler (1980) attempted to identify reading requirements regarded as "necessary" and "important" to adults in the Milwaukee area. Their survey consisted of a questionnaire listing 20 types of reading materials based on reports from the work by Sharon (1973). This study analyzed readability levels of reading materials, using the Fry Graph (1972). Negin and Krugler found the minimum level of literacy required of Milwaukee adults was very high. Readability levels of materials needed by adults in Milwaukee ranged from grade 6 through grade 17 (upper college level) with a mean of grade 12. Negin and Krugler suggested that educators must be careful not to underestimate literacy demands in urban communities.

Smith (1973) attempted to develop a finely grained view

of reading tasks performed in over two dozen career fields in Canada. His research described the kinds of materials read, the kinds of reading tasks performed, and he distinguished entry level from advanced level reading requirements. He did not, however, specify the difficulty levels of manuals in various jobs, nor did he specify what criterion levels of performance on the reading tasks related to successful performance of the job tasks, or to the acquisition of job knowledge.

Research conducted over a period of eight years by Sticht et al. (1972) for the U.S. Armed Forces focused closely on relationships between reading competence and job performance. They used an approach similar to that of Smith (1973) to identify job reading tasks. Cooks, mechanics, and supply clerks were interviewed at job sites and were asked to identify reading tasks required to carry out their jobs. Using this information, Sticht and his associates developed a literacy training program for army recruits who had unacceptably low levels of reading competence.

Sticht et al. (1972) reported that

In our own research we have found that it is possible that a person's skill in performing job-related reading tasks may be improved through explicit reading in such tasks while their generalized level as measured by standardized tests remains unchanged ... there is therefore reason to question the generality of reading skills statements made without reference to a more or less explicitly stated domain of reading material. (p.67)

Sticht (1978) reported that the reading grade levels of job literacy trainees in the job literacy programs had been raised by 2.5 reading grade levels by providing job-specific reading training in a "hands-on" job training context.

Sticht found that armed forces job manuals were as much as five or six reading levels higher than the reading levels of the recruits; only ten percent of the textbooks were below the 10th grade level. The average recruit read at 9th grade level. Often, however, recruits performed the job tasks in spite of the mismatch, by asking fellow workers for information.

Sticht observed that workers in job settings employed different reading strategies than those used by students in school settings. Sticht termed these two different information-search strategies "reading-to-do" (a process in which text is used repeatedly as an external memory device. The reader makes no attempt to remember what he has read, but refers to the print--often a shop manual--for specific information), and "reading-to-learn" (reading to remember).

Sticht (1977) suggested that any definition of literacy must be in terms of its function. His common-sense rationale was that with knowledge of the reading demands of jobs and job training, and with valid measures of an individual's skills, individuals could be matched to jobs and job training programs.

Strategies which become useful under this model are assigning marginal readers to jobs with the least reading demands, improving reading abilities to match job requirements and reducing excessive reading demands by developing improved reading materials and employing other communication the training needs. (Sticht, in Kirsch and Guthrie, 1977, p. 503)

Mikulecky and Diehl (1980) extended the research of Murphy (1975) and Sticht and McFann (1975) to the civilian population. They found that workers spent on the average, 113 minutes a day in reading activities at work. Their findings supported those of Sticht and McFann (1975), that reading at work involved, in many cases, strategies very different from those used by high school students. Mikulecky and Diehl found that workers were more efficient at gaining information from print than were high school students; because they read to gain information for specific purposes. Also workers were proficient in finding required information in a wide variety of formats.

Sticht (1972), and Mikulecky and Diehl (1980) suggested that the repetitious nature of on-the-job reading tasks allowed persons to perform job related reading tasks at as much as two reading levels higher than those the same persons were able to perform on reading tests.

Moe et al. (1979) investigated the oral and printed language requirements in ten vocational occupations, in on-the-job settings, and in vocational training programs which

led to the jobs.. They found that reading in the vocational training programs tended to be a combination of "reading to do", and "reading to learn," but they found that more "reading to learn" was required during vocational training than was required on the job. Moe suggested that "reading to learn" was more in evidence in vocational training programs because there was a need to transfer a large amount of information in a limited period of time than was true on the job. Reading on the job in all ten occupations involved almost exclusively, "reading-to-do" processes, in which print was used as an external memory device.

Moe et al. (1979) reported readability levels (using the Fry Graph) for reading materials used in the training programs and on-the-job phases of the ten occupations. They described oral language used, (segments of talk were taped from training and work sites), and they presented short lists of key words pertinent to each of the ten occupations.

Moe et al. (1979) found that reading on the job demanded accuracy and precision, but that such reading was done in short sections, often on charts, tables, graphs, and diagrams. Repetition of vocabulary and format made the mastery of the process possible for many who tested out low on conventional general reading tests.

Contemporary research in functional literacy, has attempted to identify the abilities of the population to gain information from print, to identify life activities in which the use of printed information is considered to be crucial, and to measure the readability of the actual reading materials required in these activities.

Findings of such research have been used as a basis for the development of formal inventories of skills and knowledge areas, for example, the Brigance Inventories (1981). These inventories have been promoted as curriculum guides and measurement tools for competency-based education.

With the exception of the work by Sticht et al. (1972, 1975, 1978), Moe et al. (1979) and Smith (1973), specific research in the area of reading requirements for jobs and job training programs is almost non-existent.

Related Research in Reading

Research in the areas of "literacy" and "reading" are closely related, and at times deal with similar issues, however, literacy studies have tended to take global or national views of adult reading tasks and competencies. The scope of "literacy" research has been much broader than that of "reading" research. Literacy considerations have included competencies beyond reading, such as writing,

mathematics, content knowledge areas; literacy studies have also attempted to identify life tasks which require use of printed information, and the analysis of those printed materials. Functional literacy studies have focused on skills and competencies and printed materials related to practical life tasks. Literacy considerations, then, include reading, but also involve the application of reading to a wider universe of life situations.

Reading Comprehension

Underlying all other aspects of literacy is reading comprehension -- a complex, and not yet well understood interaction between reader and text.

In 1917, E.L. Thorndike concluded that

reading is a very elaborate procedure, involving the weighing of many elements in a sentence, their organization in the proper relations one to another, the selection of certain of their connotations and the rejection of others, and the cooperation of many forces to determine final response ... the act of answering simple questions about a simple paragraph ... includes all the features characteristic of typical reasonings. (Thorndike in Harris and Sipay, 1975, p. 471)

Harris and Sipay (1975) quoted Simon's 1971 findings:

In reviewing seven approaches to the understanding of reading comprehension Simon concluded that not a great deal of progress has been made since Thorndike. Since much is still unknown about reading comprehension, both instructional procedures used and the materials employed are based more upon the intuitions and accumulated experience of reading teachers than on research

evidence....The broad principles of transfer of training apply to reading as they do to other areas of learning. Maximum transfer is possible when the training tasks resemble as closely as possible the situations in which the trained skill is to be used. (p. 472)

It is known that an individual goes through a series of developmental stages in the process of becoming a fluent reader. (Chall, 1967; Singer & Donlan, 1980; Harris & Sipay, 1975; and Sticht, 1978). Underlying all stages of reading development is the foundation of "primary resources," or pre-linguistic knowledge of how the world works (schema), and the articulation of that knowledge in oral language (Singer & Donlan, 1980; Harris & Sipay, 1975; Daniels & Diack, 1961; Sticht, 1978; and Flesch, 1981).

Sticht (1978) suggested a reading-theory model which would bring together the concerns of researchers in "reading" and researchers in "literacy". He maintained that reading research should

address the question of how the reading research can be brought to bear on understanding what types and levels of reading skill are needed to be "minimally competent" for functioning reasonably well in society.... there is a need for additional research and model building at the macro-level to address the more general problems of determining the types and levels of literacy skills needed to function in society, so that we may pursue more effective and efficient programs of human resources development. (p. 342)

Sticht (1978) found that young men enrolled in U.S. Armed Forces literacy programs "not only read at around the

fifth-grade level, but their auditing skills were also at the fifth-grade level" (p. 348).

Sticht (1978) undertook several reviews of reading research, in which he "examined and synthesized across a mixed bag of studies that provided correlations of auditing and reading task performance for different grade levels and found that average correlations grew from about +0.35 at the first grade level to about +0.60 at the fourth-grade level and stayed the same thereafter" (p. 347). Sticht cited Loban's (1964) findings that students whose oral language skills were low in kindergarten were low in reading in fourth grade and beyond.

The literature strongly suggests that, even if many children learn to decode reasonably well, their oral language skills may be so low as to render them only marginally competent in reading. (Sticht, 1978, p. 347)

Sticht submitted that training in comprehending by auditing should transfer to comprehending in reading when the reading skill was developed beyond the learning-to-decode stage. He reported that existing data showed that some students, both children and adults, did not have well-developed language and comprehension skills which they needed as a base for understanding during the process of learning to read. Sticht suggested that his data indicated that positive action might be taken to increase reading comprehension ability by teaching vocabulary and concepts through oral language.

Vocabulary: Key to the Reading Process

In its most basic form, printed language is coded spoken language. The beginning reader approaches print with a background of language patterns and a store of words (vocabulary, lexicon). The richness and diversity of the beginning reader's experiences in the world, the extent to which he has learned to name and describe those experiences in speech, and the ways in which his attention has been brought to bear on words as the labels for objects and experiences, have an effect on his success in learning to read (Heath, 1983). As the reader converts print to sound (decodes) or as he converts print directly to meaning (in lexical reading), he refers to his listening vocabulary or his meaning vocabulary, to determine whether the word he has just sounded or thought is really a word. If the word makes sense in the context of what he is reading, he proceeds; if it does not, he tries another version (Wolfe, 1968).

For the new or beginning reader, the first and very critical stage in learning to read is the act of translating printed words to speech sounds (decoding). (There has been considerable debate over how a person decodes, and how decoding ought to be taught -- Flesch (1981) and Claiborne (1983) went so far as to suggest that the failure to learn letter-sound correspondences (phonics) was a chief cause of illiteracy.)

Resnick et al. (1976) have pointed out that a reader does not decode and then comprehend. He decodes in order to comprehend. That is, the reader is constantly referring to his store of words and their meanings (lexicon) during all stages of reading.

The overwhelming importance of vocabulary knowledge to reading comprehension was demonstrated by F.B. Davis's factor analysis of reading comprehension. Davis attempted to determine if vocabulary was a separable factor in reading comprehension. Results of his factor analysis studies of reading comprehension in high school students indicated that word knowledge accounted for 89 percent of the variance in reading comprehension, leaving only 5 percent for the other comprehension subskills. Davis (1944, 1968, 1971) identified nine subskills, of which he found six to be significant:

1. recalling word meanings
2. drawing inferences about a word from context
3. getting the literal-sense meaning of details
4. weaving together ideas in the content
5. drawing inferences from the content
6. recognizing an author's purpose, attitude, tone, mood and technique.
(Davis, 1971 in Harris and Sipay, 1980, p. 471)

Refactorizations of Davis's data by Thurstone (1946) and Spearritt (1972) suggested that, except for word knowledge, most reading skills were not separately distinguishable. Refactorization revealed that word knowledge and three other skills were shown to be separately identifiable, but that the latter three skills were highly correlated and could be measuring a single skill, which Spearritt referred to as "reasoning in reading" (Spearritt, 1975, in Harris & Sipay, 1980, p. 472).

Davis suggested that the following abilities might be highly important in determining comprehension:

1. decoding skill
2. listening vocabulary
3. memory for ideas heard
4. ability to weave ideas together. (Harris & Sipay, p. 472).

Thurstone (1946, in Anderson and Freebody, 1981) reanalyzed Davis's data and found three major factors: vocabulary knowledge, ability to draw inferences from a paragraph and the ability to grasp the main idea of a paragraph.

Anderson and Freebody (1981) cited several factor analytic studies which identified a vocabulary factor in reading comprehension. They found that

this strong relationship has been found to hold across a wide range of language groups. Thorndike (1973) collected data from over 100,000 students from 15 countries, across three age groups. He found median correlations between vocabulary knowledge and reading comprehension corrected for test reliability of .71, ten year olds, .75, 14 year olds; and .66 17 year olds. Thorndike.

concluded that the results indicate how completely reading performance is determined by word knowledge at different levels and in different countries. (p. 62)

Harris and Sipay, (1975) warned that factor analysis studies might fail to differentiate between good and poor readers in their analysis. They pointed out that the fluent reader has mastered the reading subskills, and has combined them into higher units. For the fluent reader, intercorrelations among subskills should be high, making reading seem to be but one skill called "reading". On the other hand, the beginning reader has not mastered the subskills, has not combined these skills into higher units, and so the intercorrelations among the subskills should be low.

Guthrie (1973) designed special tests and analyzed the intercorrelations separately for the good and poor readers. As predicted, he found that with good readers intercorrelations were highly significant, suggesting a lack of subskills, and that reading had become but one skill. With poor readers, the opposite was found, and low intercorrelations suggested separate subskills. Guthrie concluded that interfacilitation among subskills was necessary for good reading and that one source of disability among poor readers was the lack of mastery of subskills, and therefore a failure to integrate subskills into higher-order units.

The findings of Davis (1944), Guthrie (1973) and Daniels and Diack (1961) suggest that before a reader deals with wholes, he must master smaller aspects of reading. For example, before one can visually process letter clusters as a unit, one must attend to individual letters (Daniels & Diack, 1961), and before one can understand concepts, one must have a store of meanings for the vocabulary used in describing the concepts.

As a reader becomes more fluent through practice, he begins to take in larger and larger units of print at one time. (LaBerge and Samuels, 1974, in Singer and Donlan, 1980, labelled this process "chunking.") As he becomes familiar with the vocabulary, and grammar within a particular concept area, he learns to anticipate what will be next. He then needs to take in only a part of what is there in order to grasp the thought of the author. The reader moves to a stage referred to as "automaticity." His previously labored decoding efforts become automatic. Words become so obvious to him that he does not need to think about decoding them. He may become a "lexical reader," going directly from print to meaning, by-passing the print-to-speech stage altogether (LaBerge & Samuels, 1974, in Singer & Donlan, 1980).

Singer and Donlan (1980) described the importance of vocabulary knowledge to fluent readers. As they move back

and forth through a hierarchy of levels or strategies in reading, they encounter material at differing levels of familiarity and difficulty. Even very fluent readers may backup and reread unclear material, or sound out unfamiliar words. Throughout this intricate reading process, the reader is constantly referring to his meaning vocabulary,, bringing to the text information which interacts with text to create new thought (p.458). Singer and Donlan (1980) suggested that students can develop automaticity by reading materials which are interesting but repetitious, particularly in vocabulary.

Vocabulary is so closely related to comprehension and reasoning that a good vocabulary test may serve as one measure of intelligence. Terman, in 1918, reported a correlation of .91 between mental age and vocabulary on four subscales of his intelligence measures. Correlations of vocabulary knowledge and scores on a number of different I.Q. and achievement tests have ranged from .71 to .98 (Anderson and Freebody, 1981, p. 62).

In 1968, Petty, Herold and Stoll were commissioned by the National Council of Teachers of English (USA) to examine the what was known about the teaching of vocabulary. They reported

a hesitancy to say outright that the teaching profession seems to know little of substance about the teaching of vocabulary. That we do know very little is the feeling of present investigators, however, certain studies on teaching vocabulary have shown that some teaching effort causes

students to learn vocabulary more successfully than does no teaching effort, that any attention to vocabulary development is better than none. (Petty et al., 1968, p.84)

Jenkins and Pany (1981) observed that while the research on vocabulary is enormous, it is largely descriptive. "Unfortunately, there are relatively few studies which directly document the effects of vocabulary instruction on reading comprehension" (p. 78).

In a series of experiments, Pany and Jenkins (1978), Jenkins, Pany and Schreck (1978), and Pany (1978) evaluated the effects of several vocabulary instruction procedures on a variety of measures. The instructional procedures included drilling on synonyms, telling word meanings in context or oral reading, relating words to common experiences, and providing practice in applying word meanings. Based on a number of vocabulary measures, synonym drill was consistently the most effective instructional procedure. (Jenkins, et al., 1978; Pany 1978, cited in Jenkins and Pany 1981, p.176).

Russell (1954) found that whatever form of test is used, a child's knowledge of concepts and his vocabulary are found to be closely related but not identical.

Carroll (1964) - emphasized that one of the principal tasks of teachers at all levels of education is the teaching of words, and of the meanings and concepts they

convey. He maintained that students must be taught not only meanings of unfamiliar words and uses of familiar words in unfamiliar settings, they must be made aware of

ambiguity of meaning and the role of context in resolving it. Often the task that presents itself to the teacher is not merely to explain a new word in familiar terms, but to shape an entirely new concept in the mind of the student. One would have thought that volumes would have been written on the subject, but apart from such brief treatments as those of Brownell and Hendrickson, Serra, Levit and Vinacke, for example, one searches the literature in vain for any comprehensive treatment of concept teaching. One is reassured that there are gaps to be filled. (Carroll, 1964, p. 26)

Carroll (1964) suggested that what actually goes on in most school learning of concepts is a process that combines deductive and inductive features. He pointed out that "the purpose of teaching is to short-cut the capricious process at work in the natural process of concept attainment" (p. 42).

Heath (1983) discovered that in the preparation of young children for success in school, a vital factor was the early presentation and teaching of words within particular sets of grammatical frameworks. Heath found that parents of children who succeeded in school taught

[young children] to label items and events, to describe their features....[They] immerse their children in an environment of repetitive, redundant, and internally consistent running narratives on items and events....They link items in one setting to items in another, naming the points of similarity in labels, attributes, uses and functions....It is as though in the drama of life,...parents freeze scenes and parts of scenes

at certain points along the way. Within the single frame of a scene they focus the child's attention on objects or events in the frame, sort out referents for the child to name, give the child ordered turns for sharing talk about this referent, and then narrate a description of the scene.... [they] see to it that children acquire labels for items and features which are then established as long term memory information, so that on future occasions they can retrieve this information to mediate the relations between the categories of membership and structural or attributional features of items and events They come [to school] with the skills of labeling, naming features, and providing narratives on items out of their contexts. (p. 350-351)

The Measurement of Text Difficulty

Readability and Word Lists

No discussion or investigation of reading comprehension can be far removed from a consideration of the degree of difficulty of (readability) of text.

Robinson (1978) explained that

One can discuss comprehension -- the reader's understanding of a passage following an interaction with the author -- by itself, placing emphasis on the role of the reader. And, one can discuss readability -- the relative difficulty of a passage -- by itself, placing emphasis on the nature of the material. But in reality, comprehension depends on the relative difficulty of the passage for a given reader at a given time, while readability depends on the nature, interests and background experience of a given reader at a given time. (p. 118)

A variety of factors with text contribute to the degree of ease or difficulty a reader has in understanding it. The

writer's competence in transmitting information is a function of his understanding of his topic, his articulation of ideas in clear and interesting prose, his style, his word choices, his sentence and paragraph structures, his patterns of textual organization, and his choices of format and print within which he presents his message.

Harris and Jacobson (1979) traced concerns for readable printed messages as far back as Herbert Spencer. They reported that Spencer emphasized the importance of economizing the reader's attention; Spencer thought that time and effort devoted to decoding words was subtracted from the energy left to consider meaning. Spencer underlined the importance of understanding the words used, and in getting their relationships in order to realize the thought conveyed.

The cognitive component benefits from the economy and efficiency of short, concrete words, short sentences and simple style, while the affective component benefits from stylistic variety. Spencer anticipated syntactic and semantic aspects of readability. He suggested four variables: 1) syllable length, 2) familiarity of words, 3) abstract words, and 4) sentence length. (Spencer, 1852, in Harris & Jacobson, 1979, p. 392)

Klare (1974) found that although many factors contribute to text difficulty, two measures are most important in scaling readability -- vocabulary content, and sentence length -- with vocabulary content being by far the strongest indicator of difficulty.

Traditionally, measurements of both the richness of an individual's vocabulary knowledge and measures of the reading difficulty of textual materials have been based on lists of words drawn from collections of printed materials considered to be representative of a portion of the total English lexicon.

The most comprehensive source of words in the English language would be a collection of all the words in spoken and written English -- the "lexicon" of the culture. It has been estimated that there are over 400,000 words used in spoken and written English (Claiborne, 1985). Although richness of vocabulary is a key characteristic of English, most English words occur rarely in written and spoken language. A very few words account for most spoken and written communications. According to the Ladybird Word Scheme, (McNally and Murray, 1960, in Strelich, 1981), twelve words make up one fourth of the words used in reading and writing. One hundred words make up one half of the words in common use. No person uses all English words. Each individual or population group uses a particular cross section of the total lexicon.

Claiborne (1983) observed that

the ordinary mechanic, whose skill and labor, no less than the scientist's curiosity and the capitalist's covetousness...made the Industrial Revolution possible, employed (and employs) a quite different vocabulary, consisting mostly of homely, familiar words that have acquired specialized meanings....In short, the words we use depend not just on where we live and grew up, or

how much education we had, but on what we do for a living, what we do after work, and whom we happen to be talking to. (p.261)

It is a time-honored teaching practice to control vocabulary in beginning reading (Fry, 1972). Research shows that a small number of words which occur most frequently in English make up the bulk of printed text (p. 261).

Before Thorndike's Teacher's Word Book was published in 1921, there was no objective way to distinguish familiar from unfamiliar words. The Thorndike lists indicated how "common," "frequent" and perhaps, in part, how "familiar" a word might be expected to be in English printed materials.

Thorndike's lists, and other lists which followed, have been used for many purposes, such as the development of readability formulas, as guides for writers in the preparation of materials for readers of limited skill, such as high-interest/low-vocabulary materials and textual materials for students in literacy, adult education and English as a second language programs (Harris & Jacobson, 1971).

Word frequency studies assess the frequency of occurrences of particular words in a collection of samples of written and/or spoken language. A collection of language (text or spoken) from which a frequency list is drawn is

referred to as a "corpus" or body of language. Word lists which were drawn from a wide range of genres and materials and which contain millions of words, such as those by Thorndike (1921), Thorndike and Lorge (1944), Kucera and Francis (1967), Carroll, et al. (1971), and Harris and Jacobson (1971), which included millions of words, claim to be representative of large sections of the total English "lexicon".

The Thorndike-Lorge (1944) list was compiled from over 5 million words of printed English drawn from a wide range of genres. The American Heritage List also included over 5 million words. From the American Heritage List, Carroll, et al (1971), compiled a school dictionary which they claimed described a "truly relevant chunk of the lexicon to which American children are exposed in school" (p. xli).

For his pioneering research for his Teachers Word Book (1921), Thorndike drew materials from forty-one sources, including children's literature, elementary school textbooks, practical manuals, newspapers, the Bible, English classics and adult correspondence -- about 4,565,000 running words in all. Ten years later Thorndike expanded his list from 10,000 words to 20,000 words, using counts from 200 sources, and taking words from other lists. Thorndike's efforts preceded the age of computers. His list, compiled by hand, required a massive number of hours and graduate student assistants.

Kucera and Francis of Brown University (1967), had the assistance of computer technology. They based their list on a corpus of 1,014,232 words of natural-language text, and coded it for processing on IBM and other data-processing equipment. The corpus contained 500 samples of about 2,000 words each, drawn from fifteen genres, or categories of adult reading matter. Their list contains 50,406 distinct graphic words, and gives for each word, the total frequency of occurrence, the number of genres in which it occurred, and the number of samples in which it occurred. Kucera and Francis claimed that their list was a truly adult vocabulary list representative of American English in the 1960s (Kucera and Francis, 1967).

Harris and Jacobson (1971) described the different vocabulary lists which had been compiled up to 1971, and outlined their purposes. They noted that of the many lists, very few had been drawn from sources of materials for adults. They noted the following adult lists:

1. Thorndike's lists
2. an adult writing vocabulary list by Horn (1926) which was based on more than 5,000,000 running words from adult correspondence
3. the computerized adult vocabulary list compiled by Kucera and Francis (1967), based on the Brown University Corpus of 1,014,232 words of natural language text. (The corpus contains 500 samples of 2000 words each drawn from 15 genres of adult reading matters. Correlations between this list and children's lists are much lower than correlations between

children's lists.)

Harris and Jacobson also noted lists which fell somewhere between adult lists and children's lists. These included:

1. The American Heritage Word Frequency List (Carroll et al., 1971) and
2. Taylor's list (Taylor et al., 1969 in Harris and Jacobson, 1971).

The American Heritage List (Carroll et al., 1971) is based on 10,000 samples of 500 words each, drawn from 1,000 books considered to be curricular materials in grades three to eight in 22 categories.

A Revised Core Vocabulary by Taylor (1969) contains a basic vocabulary for grades one through eight and an advanced vocabulary for grades nine through twelve. The basic vocabulary used the vocabulary contained in nine basal reader series for grades 1 through 6. For grades four through six, words appearing in three or more series were supplemented by words appearing in two series, which also appeared at appropriate levels in the Rinsland and Thorndike-Lorge lists. Words for grade 7 and 8 were those found in one or more basal series, supplemented with additional words from the Rinsland and Thorndike-Lorge lists. Words for grades nine to thirteen came mainly from the Thorndike-Lorge (1944) list and from vocabulary teaching materials for the high school (Harris and Jacobson, 1971, p. 8).

Taylor's list (1969) is the word list upon which the materials for the part-time literacy programs in Newfoundland are based. The Newfoundland literacy program kit includes a vocabulary skillbook, compiled indirectly from the Taylor list. (In a telephone interview with one of the compilers, (telephone interview, with Wayne Watton, September 13, 1985), this researcher was told that the vocabulary lists were taken "as is" from materials, which are based on Taylor's lists. A scan of the words in the Newfoundland Vocabulary Skillbook and the words in Taylor's lists, shows that a high percentage of the words in the lists are definitely geared to children. More of the words are general, everyday occurrence words. There appears to be very little or no technical or job-specific vocabulary.)

Mitzel (1966) developed a "functional literacy" word list for adults. Mitzel drew text samples from a wide range of sources. In her overview of literacy efforts in the United States, Cook (1977) hailed Mitzel's effort as being a first-of-its-kind contribution toward the definition of literacy requirements. Mitzel (1966) wrote that: "it would appear that an adult word list has the potential of being a useful tool for literacy teachers and those interested in the production of literacy materials" (Mitzel, 1966).

In 1972, Stein developed a basic word list for adult black illiterates based on a sample of 263,726 words from 128 interviews (Cook, 1977).

In 1979, Afflerbach drew up a basic vocabulary list based on federal (United States) social program application forms. Afflerbach (1979) suggested that literacy programs which seek to develop functional literacy skills might do well to incorporate most frequently encountered items in the instructional process. He also suggested that the forms could be simplified.

Harris and Jacobson (1971) identified special vocabulary lists concerned with the most important words for teaching English as a Second Language. They described Ogden's Basic English (1932; in Harris and Jacobson, 1971), a list of 850 words which were considered to be sufficient for all needs of ordinary communication. Harris and Jacobson found that the Ogden list differed greatly from primary lists and from Thorndike's (1921, 1944) lower level lists. Ogden's list was based on an assessment of concepts needed for communication among educated adults. It contained words representing abstract concepts and polysyllabic words. Harris and Jacobson also noted West's list, developed in 1953, which has been used to reduce vocabulary of adult materials used in teaching English as a Second Language.

Moe et al. (1979) examined the language requirements, both oral and written, in ten occupations. Moe's group drew up lists of key technical vocabulary from language samples for each of the trades and trade-training situations.

Harris and Jacobson (1973) compared different word lists, and found that all of the lists were very similar for the first 2,000 words. A major divergence among lists began at approximately the 7,500 word level.

Harris and Jacobson (1973) pointed out that criteria which measured validity did not apply readily to word lists. They suggested that perhaps the most appropriate way to attempt to evaluate the construct validity of a word list would be to try to answer the question: "To what extent are the design and content of the list congruent with the major purposes or uses for which the list is intended?" (p. 105).

Harris and Sipay (1975) pointed to indicators which suggested that instruction in vocabulary, in contexts which closely approximate real world settings, is especially crucial for the poor reader. They suggested that "maximum transfer is possible when the training tasks resemble as closely as possible the situations in which the trained skill is to be used" (Harris and Sipay, 1975, p. 472).

Word lists are usually presented in a descending order of frequency, presenting the most commonly occurring words first. By definition, the most frequently occurring words are considered to be those with which a reader (or writer) should be most familiar. High frequency words have been equated with "easy words," as opposed to "hard words" that

occur less often in the corpus. Although this assumption may be convenient for scaling text difficulty, reader familiarity cannot be assumed. More to the point might be that to succeed in gaining meaning from text, a reader must master the high frequency words, as well as other words likely to occur in materials he meets.

Some reading teachers have found that, far from being "easy", these high frequency words (sometimes referred to as "sight words") may be the most difficult for students to learn (Gillingham & Stillman, 1966).

Anderson and Freebody (1981) have suggested that frequency is a parameter which is very strongly related to the probability that a word will be known.

It seems reasonable that frequently occurring words should be taught thoroughly and early, in order to reduce as quickly as possible the percentage of unfamiliar words facing developing readers. It also seems reasonable to present to a group of literacy students, the words they will most likely encounter in real-life situations.

Problems may occur when there is a mismatch between the reading ability of the reader and the level of difficulty at which text is written. As Sticht (1978) pointed out, writers of vocational texts are rarely teachers of reading, and teachers of reading are rarely writers. Materials intended for a population noted for having a high percentage

of marginal readers may be filled with jargon, unclear sentences, and be written at a level more appropriate for college level readers.

Klare (1974) undertook an exhaustive examination of readability measures. He reported that readability formulas are predictive devices which use counts of language variables in a piece of writing to provide an index of probable difficulty for readers. Klare reported that formulas, unlike comprehension tests, required no reader participation, but provided a way of scaling text difficulty. Although formulas were useful devices, they were found to be no better than judgement of trained persons (Carver 1974, in Klare, p. 64). Klare (1974) found that a key factor in most readability formulas was a count of the number of words in a passage that fell outside of some standard word list, such as Thorndike's, or Dale's lists of 3,000 words.

Klare examined the many reading formulas available and concluded that unless a user of reading formulas is doing research in readability formulas

there is little to be gained from choosing a highly complex formula. A simple, two variable formula should be sufficient, especially if one of the variables is a word or semantic variable, and the other is a sentence or syntactic variable. Beyond these two variables, further additions add relatively little predictive validity compared to the added application time involved. (p. 96)

Klare (1974) found the word variable was consistently more highly predictive than the sentence or syntactic variable when each is considered singly. This appears to be the case for other languages as well as English (p. 96).

Using a list of familiar words appears to give a slightly more predictive index than counting word length, probably because length is a (secondary) reflection of familiarity....Using word lists does create practical problems, however. The most important is that one cannot hope to include all words in a piece of writing on a list. The longer a list gets, in the attempt to approach this, the more likely it is to discourage the user (eventually, even, the computer user).

Fortunately, the list need not be extremely long, since humans tend to repeat familiar words much more frequently than unfamiliar. Ten words may make up as much as 25 percent of college freshman writing; 100 words may make up as much as 95 per cent of adult telephone conversations. The sentence variable, though not as predictive of difficulty as the word variable, does have an important contribution to make to formulas. Though sentences can be evaluated in several ways, a simple count of length is generally sufficient either by hand or machine. Sentence complexity is probably the real causal factor in difficulty, but length correlates very highly with complexity and is much easier to count.

It may seem surprising that counts of the two simple variables of word length and sentence length are sufficient to make relatively good predictions of readability. No argument that they cause ease or difficulty is intended; they are merely good indices of difficulty. (Klare, p. 97)

One of the simplest measures of readability is one which is not really a formula at all, but which correlates highly with formulas. In 1965 Fry proposed a "Readability Graph" for predicting readability to save a user's time and

effort. Fry used the number of syllables per 100 words and number of words per sentence to derive reading levels for texts. Fry by-passed the problem raised by Brown and Stocker, that readability formulas based on word lists are only as valid as the list of words which they use as a reference point, and that word lists have varied widely depending on the original purposes for which they were selected. The Fry formula was found to correlate with the following well-known formulas: Dale-Chall (.94); Botel (.78); Flesch (.96) and SRA (.98) (Kistulentz, 1967, in Fry, 1972, p.235). Fry (1972) concluded that "Readability formulas have had a widespread, long-term interest among professionals in the reading business. However, the lack of their use in broader educational circles may be due to excessive working time and difficulty in computing some existing formulas" (p.234).

Fry (1972) presented his readability graph as a faster and simpler method of determining readability. He expressed the hope that it would be used widely by teachers, librarians, and publishers.

Klare (1974) found, that in some cases standard word lists did not provide a realistic representation of either the reader's background or the content of specialized texts. Klare cited the reasoning of Brown (1965) and Stocker (1968, 1971, 1972, in Klare, 1974), that the strong familiarity of

certain subject or concept-related words, such as science vocabulary or religious words known to Catholic school children, might produce readability ratings that were too high, because standard word lists did not contain science words or religious words. Specialized word list supplements were added to the general lists to make up for the differences and to portray readability of materials for specific groups more accurately. (The reasoning of Brown and Stocker corresponded to Sticht's (1971) findings that poor readers in U.S. army literacy programs increased reading levels by 2.5 levels when they read job-related materials in a "hands-on" job setting, in which there was extensive repetition and redundancy.)

Summary

The review of related research indicated:

1. Literacy is a relative and often elusive term -- a concept which is shaped by the needs and goals of particular groups of people.

2. There has been very little research with respect to the skills and knowledge required for persons to function adequately in life situations. A small number of studies in functional literacy and job literacy have suggested areas which may be of importance to the general U.S. population, but specific information regarding the reading demands (difficulty, vocabulary load, etc.) of materials which

adults are required to read on the job or in vocational training settings is almost non-existent.

2. Reading comprehension is the most fundamental factor of literacy. Although literacy may encompass a wider range of skills and tasks than simple "reading", the baseline, or point of departure, is the ability to comprehend printed information.

3. Reading comprehension involves characteristics of both reader and text, and the interaction between them.

4. Vocabulary knowledge is the most powerful factor in reading comprehension; vocabulary load, or vocabulary content of text, is the most significant factor in the measurement of text difficulty.

5. Traditionally, both measurement of the difficulty of text, and measurement of the vocabulary knowledge of individuals have been based on word lists.

6. A few word lists exist which represent general adult vocabularies, but they are somewhat dated. Only one word list to date has been generated from general functional literacy materials. Only the research of Moe et al. (1979) and Sticht et al. (1972) has presented vocational vocabulary drawn from job settings and job training programs.

In addition to the review of the literature, further information to substantiate a need for information about the requirements faced by literacy, adult education and English

as a second language students is offered in Chapter I. The review of research suggests that there is a need for word list research which is based on materials actually required by adult education students in the areas of work and of job training -- the two areas which adult education and literacy students overwhelmingly identify as being most important to them.

CHAPTER III
METHODOLOGY
Introduction

The purpose of this study was to investigate vocabulary content and reading difficulty (readability) of reading materials students face when they enter vocational training programs in Newfoundland and to compare levels of text difficulty to the grade levels required for entry into those programs. Vocabulary content of the vocational training texts was investigated by generating word frequency lists from samples of text, using accepted word list methodology.

Prior to the analysis of text, questionnaires, interviews, and discussions with students and professionals in adult education and vocational education established that there was a need for specific information regarding the vocabulary content and levels of difficulty of texts in Newfoundland's vocational training programs.

A review of the literature suggested that although many skills and knowledge areas have been identified as pertinent to "general literacy", "functional literacy" and "functional competency", the identification of the vocabulary content of vocational training materials has not been given much attention. Only limited research (Sticht, 1972, 1975, 1978;

and Moe, 1979) has been undertaken to investigate reading requirements in work or vocational training situations. Only one relevant study, the work of Smith (1973) has been undertaken in Canada.

Prior to this study, students in one Newfoundland literacy and adult education center identified work and vocational training as the strongest reasons for returning to school. Discussions with adult education students and instructors from other centers, and with supervisors and instructors in vocational programs led to the selection of 15 vocational training programs considered to be appropriate for this study. The criteria used in choosing these programs were:

1. The programs had low entry requirements of less than grade 12 (or grade 11 under Newfoundland's old high school program).
2. Each program was of 10 months or less in duration.
3. Each program was one to which adult education students indicated that they aspired.

The 15 vocational training programs selected for this study were:

1. Auto Body Repair
2. Barber-Stylist
3. Beauty Culture
4. Bricklaying
5. Carpentering and Joinery
6. Commercial Cooking
7. Electrical (pre-employment)
8. Heavy Equipment Repair
9. Machinist
10. Motor Vehicle Repair (Mechanical)
11. Power Engineering

12. Printing
13. Sheet Metal
14. Waiter/Waitress
15. Welding

Vocational instructors and supervisors at the Cabot Institute in St. John's, Newfoundland, provided lists of the reading materials (textbooks) they required their students to master. All of the texts (47) used in 15 vocational training programs were made available to this writer by the Cabot Institute.

An annotated bibliography of the 47 texts (Appendix A.) notes special characteristics of texts, such as style and high content of mathematics, charts, graphs, and tables.

Word Frequency Lists

Sampling Procedures

The vocabulary content of the texts required in each of the 15 vocational training programs was investigated by sampling the texts and compiling word frequency lists for each program. Selection of text sampling methods followed methods used by Carroll et al. (1971). The definition of "a word" used in this study is similar to the definition used by Hillerich (1980).

The American Heritage list (Carroll et al. 1971) contains over 5 million words drawn from materials read by school children in grades 3-9. It includes ten thousand

500-word samples of running text. Carroll et al. (1971) used uniform sampling of each text instead of a random sampling "to assure at least minimal coverage of lexically and stylistically segmented texts" (Carroll et al., 1971, p. xviii).

Samples for this study were taken at approximately uniform intervals throughout each of the 47 texts. The sampling interval for each text (i.e. the number of pages between the first page and successive samples) was determined by dividing the number of pages in each text by six. The first sample was taken from page one of the text; subsequent samples began at uniform intervals (the total number of pages divided by six) thereafter. Six samples of approximately 200 words each were taken from each text, for a total of approximately 1200 words for each text.

Following the sampling decisions of Carroll et al. (1971), all running text consisting of complete sentences was eligible for inclusion in the samples, with the exception of the following:

- headings
- captions
- footnotes
- glossaries
- tables
- word lists
- indexes
- phonetic spellings
- numbers
- foreign words in long foreign passages

In practice, it was not always possible to maintain absolutely uniform sample intervals -- especially in texts including charts, diagrams, mathematics and graphics. In this study, graphs, charts, and diagrams often appeared on selected sample pages. If a page contained a large proportion of graphics, the next page of running text was selected instead.

Each sample page was photocopied. Two one-hundred word samples were counted from each of the photocopied pages, to comprise approximately 1200 words per text.

Definition of "A Word"

The definition of what constitutes a "word" in word list research depends upon the purposes for which the word lists are to be used. Word lists surveying the entire content of English language used in a particular decade or century, such as the Thorndike Lorge list (1944), or the Kucera-Francis list (1967), included everything "bounded left and right by white space," including numbers, abbreviations, foreign language entries and symbols.

In contrast, children's lists often count only a base word, and present all forms of that word, such as plurals, possessives, and inflections, as subsets of that word, including it that word's category (Harris and Jacobson, 1971).

Hillerich (1980) tested poor readers at the junior high

level during the development of a word recognition vocabulary to be used in high interest-low readability books for adults. He found that junior high students who read at the third and fourth grade levels made four times as many errors as did third graders reading at the same level. He found no answer to the question of why some words are more frequently recognized than are others. His study raised doubts about the commonly accepted practice in reading instruction wherein educators assume that if a base word is known, its regular inflected forms are known. He found, for example, that no student missed 'be,' but 'being' was rejected from the list as missed by more than 20 percent of the population; no student missed 'old,' but 'older' was missed by 12 percent. Hillerich's (1980) study was one in which a word list was based on words recognized by a particular population of poorer readers. His findings suggested that knowledge of a root or base word is not an indication that other forms of that base word are likely to be in the reader's vocabulary.

Because the lists generated for this study were intended for poor readers such as those for whom Hillerich's list was designed, no assumption was made that a reader would or would not know base words and word variations, it was decided to list occurrences of all different forms of a base word as separate words.

For the purposes of this study "a word" was defined as

"all sequences of letters bounded by white space, left and right, but excluding abbreviations, all numerals and mathematical symbols."

Computer Entry, Sort and Merge

The six 200-word samples from each of the 47 texts were entered as running text on the Memorial University's VAX-VMS-1 computer system. The samples were indexed according to vocational program, and text. The text samples were sorted and merged, using a FORTRAN sorting program, into 30 word lists -- two lists for each of the 15 vocational training programs selected for this study. The first list presents the words in descending frequency of occurrence, and the second in alphabetical order. The absolute and relative frequencies of each word were recorded. The word lists are presented in Appendix B.

A final list merged all occurrences of the words in all of the samples. This larger, merged list represents the frequency of occurrence of all words in the total corpus selected for this study.

The merged list reflects the fact that there were more texts required in some of the vocational programs than in others. For example, eight texts were required in the electrical program, while barbering required two. Because of the bulky nature of this larger frequency list, it is not

reprinted in this study, but it is available on computer diskette.

The final merged list may be of use to others who wish to continue the development of a larger vocational corpus, or to those who might wish to include the list as a vocational component for a "general core vocabulary" for adult literacy.

Readability Measurement

The review of literature in Chapter II indicated that the most powerful factor in reading comprehension is vocabulary -- the vocabulary knowledge of the reader, and the vocabulary content of text. Many factors contribute to text difficulty (Harris and Jacobson, 1979), but Klare (1974) concluded that a fairly accurate scaling of text difficulty can be made by using two variables -- vocabulary content and syntactic complexity (usually measured by sentence length).

It may be argued that any readability formula is at best, a rough, ballpark prediction of the difficulty an individual reader will have with a particular text. The scaling of text difficulty is only a guide. The relationship of readability level to grade-completion level is also somewhat questionable with respect to accuracy, but as Sticht (1978) suggested, it gives us all some notion of what we are talking about.

the reading grade level is a useful convenience for succinctly summarizing an amorphous domain of skills and reading in a manner which provides a frame of reference for understanding a person's general reading ability level. The reading grade level has a 'psychological' meaning in that most people 'feel' that they understand the difference between a person who reads at the 3rd grade level as opposed to one who reads at the, say, 8th or 12th grade level. Furthermore, since most adult basic education programs currently use the reading grade level in stating objectives, it seemed appropriate to relate this research to this common practice. (Sticht, 1972, p. 463)

Early studies of readability considered reading difficulty to be a function of vocabulary load, and used word lists as a basis for formulae. Later measures of readability have moved toward simplicity and ease of application (Fry, 1972; Klare, 1974).

Vocabulary difficulty and sentence length in the right combination provide the best and most efficient measure of reading difficulty (Chall, 1957; Klare, 1974; Bormuth, 1968). "Vocabulary difficulty" is usually defined and measured by counting the percentage of words not appearing on a particular word list. Measuring the difficulty of specialized textual material, however, may be inaccurate, for specialized vocabularies may not appear in a general list. If text difficulty is measured based on a general word frequency list, specialty words may be judged more

difficult than they may be in a familiar context area. Sticht et al. (1972) for example, found that existing readability formulas had limitations when applied to a study of reading requirements of military occupational specialties. Although the U.S. military formula could, with extensive work, be applied to vocational materials, it is simpler and equally effective to rely on the Fry Readability Graph. The Fry Graph (1972) does not base measurement of text difficulty on word frequency lists. The method avoids the problem of disparity among word lists, while it correlates closely with word-list-based formulas.

The Fry Graph

The Fry Graph (1972) uses variables of number of syllables per 100 words, and word per sentence. Klare (1974) indicated that "Though sentences can be evaluated in several ways, a simple count of length is generally sufficient. Sentence complexity is probably the real causal factor in difficulty, but length correlates very highly with complexity and is much easier to count" (p. 97). Klare reported that, "Fry's graph has been validated on both primary and secondary materials, and the scores derived from it correlate highly with those from several well-known formulas" (p. 77).

Measurement of the readability of vocational materials

requires a method which does not use an existing word list as the basis of a formula. This is important because many words may seem less familiar than they come to be when they are presented in a repetitive vocational context. The word lists commonly used as standards are often drawn from children's school readers and high school texts. One of the arguments against the use of such word lists in job literacy research, is that there is a wide discrepancy between "school" materials and "work" materials. The Fry Readability Graph seems to be the simplest measure, and a sufficiently valid measure of reading difficulty for the purpose of this study.

The same samples of text which were used to generate word frequency lists were used to measure the reading difficulty levels of the vocational texts. Each of the 200 word samples was divided into two 100-word samples. The word samples were broken into syllable counts, and readability was measured using the Fry Graph.

The Fry Graph (1972) was chosen for ease of application, for although it correlates highly with other readability formulas, which are based on word lists, it is not dependent on a specific word list. It uses measures of the number syllables and number of sentences in 100 word samples of text (Fry, 1972).

The Fry Graph was applied in the following manner:

1. For each text, the number of sentences in each of the twelve 100-word samples was counted and averaged.
2. For each text, the number of syllables in each 100 word sample was counted and averaged.
3. For each text, the average number of sentences per 100 words and the average number of syllables per 100 words were plotted on the Fry Graph.
4. Plotting these two points on the graph indicated an approximate grade level of reading difficulty.
5. The readability level of each text was listed in Table 1, and is presented in comparison to the grade level required for entry into the corresponding vocational program.

The results of this study are presented in Chapter IV.

CHAPTER IV

RESULTS AND DISCUSSION

Introduction

The results of the investigation of vocabulary content and reading difficulty levels of vocational texts by means of word list research and readability measures are reported and discussed in this chapter. The first section reports on the development of the word lists and discusses their potential uses.

The second section reports on the readability levels of the vocational texts selected for this study, and compares the text levels with the grade levels required for entry into the 15 vocational training programs. During informal discussion and interviews with this writer, vocational instructors offered their opinions and observations of problems their students were or were not having with the textual materials. These observations are included in this chapter following the report on readability levels.

Vocational Word Frequency Lists

The word frequency lists compiled for this study represent samples of vocabulary required in each of 15 vocational programs. Each of the 15 lists is given in two formats, in alphabetical order, and in descending frequency of occurrence of the words, with the most frequently

occurring words listed first. These word lists are intended as a teaching tool and as a guide to writers of materials for adult education. These lists represent samples of vocabulary specific to particular trades and trades training. The lists may be used as sources of words for teaching decoding, word recognition, and meaning vocabularies. They may also function as a "vocational component" to be included in instructional materials which are designed to be relevant to adult learners. These lists may be included in self-paced reading development programs, and may serve as sources of vocationally related vocabulary in the creation of screening tests.

Vocabulary knowledge and word recognition skills require multiple exposures and repetition. It would seem practical to present relevant, vocationally related vocabulary to beginning and developing readers. The present practice is to teach literacy and adult education courses using general materials which are intended for children or high school students. The word lists in common use are made up of general words; rarely if ever are vocational words included.

For example: general words lists do not emphasize words such as those found at the top of the vocational frequency lists, such as:

1. catalyst, equipment, material (auto body repair)
2. hair, chemical, processor, patron (barber/stylist)

3. follicles, hydroscope, lymphatic, objective, tints, application, derivative (beauty culture)
4. masonry, mortar, courses, level, radius (bricklaying)
5. concrete, foundation, joists, lines, framing, flashing (carpentry and joinery)
6. dough, stock, icing, ingredients (cooking)
7. current, voltage, coil, load, phase, series, resistance (electrical)

The word lists in Appendix B. indicate that vocational reading materials contain a large number of multi-syllabic words which have specialized meanings in the vocational context. It seems reasonable to make these vocabularies available to students before they enter vocational training programs -- just as reasonable as presenting them with the general vocabularies which are presently in use. At the very least, these word lists are offered as optional components which individuals could elect to study on an individualized basis.

Readability Measurement of Vocational Texts Using the Fry Graph

The readability levels of the 47 texts used in the vocational training programs are presented in Table 1. The readability levels determined by using the Fry Graph are compared to the grade levels required for entry into the programs (Table 1).

The fifteen vocational training programs selected for this study were chosen because they are programs which literacy and adult education students wish to enter, and the entrance requirements for the programs suggest that individuals with modest abilities in reading might hope to succeed in them. Grade level prerequisites varied from grade 8 to grade 10. The fifteen programs were:

1. Electrical
2. Brick laying
3. Carpentry and Joinery
4. Sheet Metal
5. Barber stylist
6. Beauty Culture
7. Commerical Cooking
8. Waiter/Waitress
9. Printing
10. Heavy Equipment Repair
11. Machinist
12. Mechanical Auto Repair
13. Auto Body Repair
14. Power Engineering
15. Welding

The readability level of each text for each of the 15 vocational programs was measured using the Fry Graph (1972). The individual texts were assigned numbers, e.g. "text 1", "text 2", and so forth, for each of the vocational programs. Complete bibliographic information for each of the texts is provided in the annotated vocational text bibliography in Appendix A. The readability level of each of the texts and the grade level required for program entry are presented in Table 1.

TABLE 1

Prerequisite Grade Levels for 15 Vocational Training Programs;
and Reading Levels of the Vocational Texts Used in Those Programs
as Measured by the Fry Graph

Vocational Training Program	Entry Grade Required	Text 1	Text 2	Text 3	Text 4	Text 5	Text 6	Text 7	Text 8
Electrical (Basic)	Grade 10 18 Credits 2nd yr MES	9.5	Coll.	10	12	Coll.	Coll.	12	Coll.
Brick Laying	Grade 8	9.5	7-8						
Carpentry & Joinery	Grade 9 MES	Coll.	9-10	9.5	12 to Coll.				
Sheet Metal	Grade 10 18 Credits	7 - 8	high 9	low 8	9.5	10-11			

Coll. = College Level or above reading level
MES = Mathematics, English and Science required
for course entry.

Texts are listed by corresponding numbers in
the annotated Bibliography, Appendix A.

Machinist	Grade 10 18 credits 2nd yr MES	8.0	12						
Mechanical Auto Repair	Grade 10 18 credits 2nd yr. MES	8.0							
Auto Body Repair	Grade 8 MES	high 12 to Coll.							
Power Engineering	Grade 10 18 credits	Coll. 16.0	11-12	Coll. + Coll. + (upper college levels)					

TABLE 1, Continued

Vocational Training Program	Entry Grade Required	Text 1	Text 2	Text 3	Text 4	Text 5	Text 6	Text 7	Text 8
Welding	Grade 10 18 credits 2nd yr. MES	11-12	7.0						
Academic Texts, English		10.0	10.0						
Academic Texts Mathematics, not included in study, different readability measures required.									

Entry to basic electrical training (pre-employment) requires grade 10, with second year high school mathematics. As measured by the Fry Graph, the eight texts required in this course range in difficulty from grade 9.5 (text 1), to upper college level (texts 2, 5, 6 and 8). Although the Fry Graph does not offer precise calibrations in the upper college level range, two of the texts were ranked above the "grade 16" level, a level which could be difficult for some college graduates, let alone someone with limited reading ability.

Entry to the course in the building trades -- Bricklaying, Carpentry and Joinery, and Sheet Metal -- required a grade level of grade 8 for Bricklaying, grade 9 for Carpentry and Joinery, and grade 10 for sheet metal. For Bricklaying and Sheet Metal, there was a close match between entry requirements and the difficulty of texts. Bricklaying texts were in the grade 7 to grade 9.5 range, while the Sheet Metal texts ranged from grade 7 or 8, to grade 10-11. The Carpentry and Joinery program required two texts which were in line with the entry requirements, but also required two books of greater difficulty. One was at the grade 12 to college level, and the other was college level. The most difficult of the Carpentry texts was a code book of standards, which was used continuously as a reference. (The Carpentry instructor suggested that with repeated use the students learned to read the code book).

In the service trades, the entry levels for the programs did not reflect the difficulty of texts. Entry level for a Barber/Stylist trainee was grade 9, while the two key texts were ranked at high grade 12, and at college level. For Beauty Culture, both texts had upper college level readability. The Waiter/Waitress course, which had no minimum entry prerequisites required a text with a readability level of grade 11.

In contrast, the Commercial Cooking course had an entry level of grade 8, and texts of grade 8 and low grade 9 readability. The Printing course, which had an entry level of grade 10, had as its major text, a book with a readability level of grade 7.

A comparison of the readability levels of text and the entry requirements for Heavy Equipment Repair, Machinist, Mechanical Auto Repair and Welding showed only minor differences. Heavy Equipment Repair required an entry level of grade 10; texts ranged from grade 9 to grade 11.5. The Machinist course had an prerequisite of grade 10, with texts ranging from grade 8 to grade 12. Mechanical Auto Repair required grade 10 for entry, but had a text of grade 8 difficulty.

Auto Body Repair and Power Engineering, however, showed major differences between text levels and entry levels. The entry level for Auto Body repair was grade 8, while the one large text used throughout the program

measured a high grade 12 to college level. The most extreme disparity was in Power Engineering, where the entry to the 4th class power engineering course was grade 10. All of the textual materials in the course were at a high grade 12 or upper college level.

Informal interviews with supervisors and instructors in the vocational programs were undertaken to gain additional information about the uses of texts in the programs, and to identify problems perceived by the instructors. The instructors were asked if Adult Basic Education was adequately preparing students for their courses, and whether they perceived their students to have problems with reading.

The supervisor of the electrical pre-employment division said that he found that ABE students and some of his other students were deficient in reading, mathematics and problem-solving skills. He claimed that students were often completely lost when asked to read a text.

Instructors in the building trades found their adult students had less difficulty than did electrical students. They did not perceive their students to have problems reading the materials. The only course in which reading was considered to be a problem in the building trades was in the Carpentry and Joinery program. The Residential Standards Code Book was identified as a text which challenged some

students.

In the service trades, instructors indicated that the students used competency-based learning modules in which they progressed at their own pace. Service trades instructors showed this writer how the competency based units had been drawn word-for-word from the previously used vocational texts. The materials had simply been given a different organizational format. The service trades instructors noted that students in Beauty Culture had difficulty reading the text for the simple chemistry course which was required. The Printing instructor said he read the text for his course out loud to his students, for he felt that if they were left to read the materials on their own, they would not understand.

The Heavy Equipment instructor complained that he had to spend a great deal of time coaching and counselling students with reading problems, and that he also read the materials out loud in class.

Instructors in Welding, Sheet Metal and Auto Body Repair had no complaints; they were satisfied with their students and materials.

The Power Engineering instructor complained that the materials available for the power engineering course were written in unnecessarily difficult language. He opened books and pointed to obscure words and long, tortured sentences. He said that the program's reading materials

could be understood only by readers who had were reading at a university level, and that they were written by writers who had no awareness of readability. He reported that his students "dropped out like flies".

Comparisons of the readability of the vocational texts with grade-level prerequisites showed that there were great differences in the two statistics for a few of the vocational programs, but not for others. Informal discussions with vocational instructors also suggested that the readability levels of text posed a problem for some students, but not for all of them.

Summary

An investigation of the vocabulary content and readability levels of texts required in 15 vocational training programs in Newfoundland yielded word frequency lists for each of the 15 programs. These lists are presented as teaching tools for vocabulary development and testing. A larger, merged list is also available on computer diskette for those interested in extending this research.

Readability levels of texts were compared with entry prerequisites -- grades completed. This comparison indicated that a few vocational training programs have very high, above college level reading materials, even though the grade

levels required for entry to those programs do not indicate the reading challenged the students will face. Other programs required reading materials which were at the level of the grade required for entry, or required materials which were below the entry level. These findings are presented in tabular form in Table 1.

CHAPTER V

SUMMARY, DISCUSSION, AND RECOMMENDATIONS

Introduction

"When I finish night school I would like to go in to trade school and take nursing assistance or to be a hair stylist, but right now I am not sure. Hopefully then I would have my mind made up. My goal is to finish school and to have a good job and a complete life.

"I am here to get my grade 12 and then go to trade school."

"I am here because I would like to finish grade 12 and get my high school diploma. My future plans are to finish high school and get a job."

"The reason why I decided to attend the night school was to start planning for my future. I hope to finish these courses with high enough grades to get accepted for trade school or college...something related to the sea."

(quotations from statements written
by students entering the adult
education evening programs at an
adult education center in
Newfoundland, 1980-1988)

Individuals seeking aid in improving their literacy skills need and want programs which help them reach their goals with the greatest utility and economy of time and effort. Students entering Newfoundland adult education and literacy programs have a strong orientation toward career and vocational goals.

In the past literacy programs have suffered from a lack of clarity in their goals and objectives. The identification and analysis of reading requirements for the performance of tasks in daily life have become the focus of contemporary functional literacy research.

Current literacy and Adult Basic Education programs in Newfoundland tend to use "general" materials, rather than job or trade specific materials in the teaching of reading and reading improvement. ABE curriculum developers have claimed that it is better to promote "process" than it is to promote "content". The argument goes that in this world of exploding information and technology, one must be flexible. This focus on "process" seems to be aimed at producing a minimum standard of "general" literacy, and reflects the tacit assumption that the high goals and ideals of a classical education are appropriate for all members of society. This is an approach which prescribes what reading requirements should be, rather than inquiring what actual reading requirements in particular situations are.

Individuals who enter adult education programs may not be entirely aware of the options education offers them. Thus at some level a prescriptive approach is appropriate. However, they clearly have some goals in mind when they enter these programs, the most frequently recurring one being the desire to get a job.

The review of the literature revealed that vocabulary knowledge is the most powerful factor in successful reading comprehension. Vocabulary content is one of the key indicators of text difficulty. Knowledge of the meanings of words underlies success in reading from the earliest stages of decoding print to the most sophisticated and technical levels of reading. Furthermore, as Robinson (1978) pointed out, process is in most cases embedded in content. Each content area requires its own strategies and has its own formats and vocabulary.

This study identified vocabulary content and reading difficulty levels of textual materials required in 15 10-month vocational training programs in Newfoundland. Word frequency lists for each of the 15 programs were generated from samples of the texts required by those programs. The word lists are offered as teaching tools to those working in adult education. Readability levels of the texts were measured using the Fry Graph (1972), and were related to the entry requirements for the programs. The comparisons of readability and entry level are offered for use in the placement of students in vocational programs, and as information to those who are concerned with the difficulty of texts in vocational education. (The results of these

comparisons are presented in Chapter IV).

A comparison of the word lists presently used in Newfoundland's literacy programs with the word lists generated in this study makes clear the lack of vocational orientation in the current program. It is the opinion of this writer that supplementary sets of word lists based on vocational texts and reading materials relevant to the vocational interests of the students would make a relevant contribution to literacy, ABE and ESL programs. Also, close simulation of situations in which students will find themselves when they enter vocational training and job environments should enhance their mastery of job-related text.

Literacy and adult education instructors may facilitate the future success of their students in vocational training by providing practice in:

1. decoding of vocational vocabulary and high frequency words, and in providing enough practice to develop automatic recognition of as many of the words as possible.
2. building of vocabulary knowledge; through the development of oral and listening vocabularies and through linking printed words to concepts in hands-on situations.
3. writing/spelling the words, and learning the types of writing needed in the vocational and job settings.
4. gaining familiarity with the formats in which vocational training and job

information is presented, e.g. charts, graphs, forms to be filled out.

5. gaining actual practice in the processes of "reading to do," using information as an external memory device, looking up things that do not have to be remembered.

It is not the intention of this writer to suggest that jobs and vocational training should be the sole focus of adult education programs, but vocabulary and concepts from the job world should certainly be included as an important element of the curriculum, or should at the very least, be made available.

With the advent of self-paced learning (with or without the use of computers), it should be possible to let a particular student work on vocabulary and concepts which are directly related to that student's vocational goals. This may not only encourage that student to stay in school longer, because he is moving at his own pace and is dealing with concepts and materials he perceives as relevant to him, it should also increase his chances of success.

Word lists have many uses. The review of the literature on word lists indicated that word lists are the standard for measuring vocabulary content in a given passage. They are also the source of words for vocabulary test makers and writers who are conscious of readability in their work.

Recommendations for Further Research

This study took a close look at textual materials presently required in a selected number of Newfoundland's vocational training programs. A similar investigation could be made of additional programs, to give a more complete picture of reading requirements in all of the vocational training programs in Newfoundland. For the purpose of this study only programs with the most modest entry requirements were selected.

Vocational programs which are offered at any given time should reflect the needs of the present and future job market. It is possible that some of the vocations for which training is presently offered promise only limited possibilities for employment. Literacy and adult educators must stay aware of current and future demands industry and the job market in order to counsel students to make wise career choices. Perhaps it would be valuable to investigate the demands of reading on the actual job sites. It is possible that vocational training program requirements do not accurately reflect the reading requirements of the work place.

Word list research might usefully be extended to include other vocational training programs, and might also

include more general reading materials relevant to functional literacy, such as the content of newspapers, magazines, and government documents.

Vocabulary content considered to be relevant to a particular population will change over time. Word list research requires continuous assessing of people's needs and goals, and a process of updating vocabularies for specific needs.

The effectiveness of presenting the vocationally-related vocabularies to students prior to their entry to vocational training programs is an area wide open for investigation.

APPENDIX A

Annotated Bibliography of textbooks used in the vocational Courses Selected for this Study:

Electrical (Pre-employment)

- Text 1. Duff, John R. and Kaufman, Milton. (1980). AC fundamentals. Albany, New York: Delmar Publishers.

Readability Level (Fry) 9.5

This text contains a substantial number of trigonometry tables, mathematics problems, diagrams which require an understanding of vectors. Although the Fry measure is 9.5, the vocabulary demands appear to be extremely high. Information is presented in a tightly packed style. It would appear that comprehension of terms depends on direct, hands-on activities with the instructor teaching vocabulary for each chapter.

- Text 2. Loper, Orla E. (1978). Direct current fundamentals. Albany, New York: Demar Publishers.

Readability Level (Fry) 16+ Upper College Level.

A large number of clear diagrams tend to clarify the information presented in the text. The author seems to be writing from a position of technical expertise, but the sentence constructions are long and convoluted.

- Text 3. Kulala, Thomas S. (1981). Electricity 1--Devices, circuits and materials (3rd ed.). Albany, New York: Delmar Publishers, Inc.

Readability Level (Fry) Middle of Grade 10.

Text incorporates basic mathematical formulas, charts, diagrams, photographic illustrations.

- Text 4. Kulala, Thomas S. (1981). Electricity 2--Devices, circuits, and materials (3rd ed.). Albany, New York: Delmar Publishers, Inc.

Readability Level (Fry) High Grade 12, college entry.

Contains physics formulas, diagrams, but is largely running text.

- Text 5. Alerich, Walter N. (1981). Electricity 3--DC motors and generators, controls, transformers (3rd ed.). Albany, New York: Delmar Publishers Inc.

Readability Level (Fry) College Level.

Although the sentence construction is not exceptionally complex, the vocabulary terms of a technical nature make up an extremely high percentage of text. Without specific instruction or familiarity with the technical vocabulary, this text would be very difficult to understand.

- Text 6. 1982 Electrical Code Part I: Safety Standards for Electrical Installations. (1982). Rexdale, Ontario: The Canadian Standards Association.

Readability Level (Fry) Upper College Level.

This handbook contains a substantial proportion of charts and tables. It is written in a style which borders on "legalese jargon." Only constant use of this handbook would make the information accessible.

- Text 7. Mullin, Ray C. Electrical wiring--residential. (1978). Albany New York: Delmar Publishers. Readability Level (Fry) Low Grade 12.

- Text 8. Barker, Forest L., & Wheeler, G.J. (1978). Mathematics for electronics (2nd ed.). Don Mills, Ontario: The Benjamin Cummings Publishing Co.

Readability Level (Fry) College Level and above.

Requires advanced trigonometry, and includes concept of functions, wave forms, etc.

Building Trades: Bricklaying, Carpentry & Joinery, Sheet Metal

Bricklaying:

Text 1. Kreh, R.T., Sr. Advanced masonry skills. (1978). Albany, New York: Delmar Publishers, Inc.

Readability Level (Fry) Middle of Grade 9.

Text 2. Kreh, R.T., Sr. (1976). Masonry skills. Albany, New York: Delmar Publishers, Inc.

Readability Level (Fry) Upper Grade 7 to lower Grade 8.

Carpentry and Joinery:

Text 1. Capatosto, John. (1980). Basic carpentry. Reston, Virginia: Reston Publishing Co., Inc. (Prentice-Hall).

Readability Level (Fry) College Level.

Text 2. Moore, Carl E. (1977). Concrete Form Construction. Albany, New York: Delmar Publishers Inc.

Readability Level (Fry) High Grade 9 to Low grade 10.

Text 3. Canadian Wood-Frame House Construction (Metric ed.). Canada Mortgage and Housing Corporation.

Readability Level (Fry) Middle of Grade 9.0.

Telegraphic style, close-packed with technical terminology.

Text 4. Residential standards. (1980). Ottawa, Ontario: The Associate Committee on the National Building Code--National Research Council of Canada.

Readability Level (Fry) High Grade 12 to college.

Graphs, charts, terse style, high percentage of complex sentences, dependent clauses, etc.

Sheet Metal:

- Text 1. Meyer, Leo A. (1979). Sheet metal layout (2nd ed.). Toronto: Gregg Division/McGraw-Hill Book Co.

Readability Level (Fry) High Grade 7; low Grade 8.

Simple, clear diagrams, clear, short sentences, a high degree of explanation of terms. Fluid easy to ready style.

- Text 2. Mathematics for Sheet Metal Fabrication. (1970). Albany, New York: Delmar Publishers, Inc.

Readability Level (Fry) Upper Grade 9.

Basic measurement (non-metric), geometry, figures.

- Text 3. Zinngarbe, Claude J., & Schumacher, Fred W. (1975). Sheet metal machine processes. Albany, New York: Delmar Publishers, Inc. (Litton Educational Publishers Inc.)

Readability Level (Fry) Grade 8.

- Text 4. Zinngarbe, Claude J. (1971). Sheet metal blueprint reading for the building trades. Albany, New York: Delmar Publishers, Inc.

Readability Level (Fry) Middle of Grade 9.

- Text 5. Zinngarbe, Claude J., & Schumacher, Fred W. (1974). Sheet metal hand processes. Albany, New York: Delmar Publishers, Inc.

Readability Level (Fry) High Grade 10, low Grade 11.

Service Programs: Barbering, Beauty Culture, Commercial Cooking, Waitress, Printing.

All of these programs are going to individualized Units of material. However, the units are drawn from the text identified below. A separate sampling of unit materials are teacher-prepared materials was not done for this study because their units were still in the process of being developed. Interviews with instructors and the developers of the units indicated that the materials are drawn from the texts listed below, most often in word-for-word sections.

Barber-Stylist:

Text 1. Barber Styling Textbook Committee. (1977). Standard textbook of professional barber-styling. Bronx, New York: Milady Publishing Corporation. 3839 White Plains Road.

Readability Level (Fry) High Grade 12.

This text is used for the trades course, the shop course, and the second half of it is used for the science aspects of Barber Stylist training.

Beauty Culture:

Text 1. Kibbe, Constance V. (1981). Standard textbook of Cosmetology (rev ed.). Bronx, New York: Milady Publishing Corporation.

Readability Level (Fry) College Level.

Numerous illustrations. Careful definition of terms provided in each chapter. Fluid style.

Text 2. Powett, A.H. (1980). Hair structure and chemistry simplified. White Plains, New York: Milady Publishing Corporation.

Readability Level (Fry) College Level.

This text is used for the chemistry section of the science program which accompanies Beauty Culture and the Barber Stylist program.

Commercial Cooking:

Text 1. Sultan, William J. (1969). Elementary baking. New York: McGraw-Hill Inc.

Readability Level (Fry) Grade 8.

Text 2. Haines, Robert G. (1983). Food preparation for hotels, restaurants and cafeterias (2nd ed.). Chicago: American Technical Publishers Ltd. (11th printing).

Readability Level (Fry) High Grade 8, low Grade 9.

Text 3. Folsom, LeRoi A. (Ed.). The professional chef (4th ed.). Prepared by the Culinary Institute of America and the Editors of Institutions Magazine. Boston: Mass.: C.B.I. Publishing Company Inc.

Readability Level (Fry) Grade 8.

Waiter/Waitress:

Text 1. Ross, Jean. (1964). Every customer is my guest. Province of Nova Scotia: Planning and Development, Department of Tourism.

Readability Level (Fry) High Grade 7.

Text 2. Dahmer, Sondra J., & Kohl, Kurt W. (1982). The waiter and waitress training manual (2nd ed.). Boston, Mass.: CBI Publishing Company Inc.

Readability Level (Fry) Low Grade 11.

Printing:

- Text 1. Walker, John R. (1980). Graphic arts fundamentals. South Holland, Illinois: The Goodheart-Willcox Company Inc., Publishers.

Readability Level (Fry) Grade 7.

Highly illustrated with diagrams, photographs. Objectives are presented at the beginning of each chapter, with a follow-up "test your knowledge" section at the end. Clear, easy style. The instructor of printing indicated that in spite of the appealing text, it is also common practice to read the material to students during classes. Concept units are drawn from text and are supplemented by instructor prepared materials. In process of unit development.

MECHANICAL PROGRAMS:

HEAVY EQUIPMENT REPAIR
MACHINIST
MOTOR VEHICLE REPAIR (MECHANICAL)
MOTOR VEHICLE REPAIR (BODY)
POWER ENGINEERING
WELDING

Heavy Equipment Repair:

- Text 1. Toboldt, William K., & Johnson, Larry. (1975). Automotive encyclopedia--Fundamentals principles, operation, construction, service and repair. South Holland, Illinois: The Good Heart Willcox Co. Inc.

Readability Level (Fry) Middle of Grade 11.

- Text 2. Toboldt, William K. (1973). Diesel fundamentals, service, repair. South Holland, Illinois: The Goodheart Willcox Co. Inc.

Readability Level (Fry) High Grade 10.

Clear style. Complete glossary. Trouble-shooting charts for systems. Diagrams.

- Text 3. Nichols, Herbert L., Jr. (1980). Heavy equipment repair (2nd ed.). Greenwich, Conn.: North Castle Books.

Readability Level (Fry) Low Grade 9.

Lots of diagrams, charts and graphs. Personal style. Author addresses reader as "you". Abbreviated, telegraphic style. Simple math and science concepts. This text is more of a reference manual. Student must know how to look up information in this book.

Machinist:

- Text 1. Burghardt, Henry D., Axelrod, Aaron, & Anderson, James. (1959). Machine tool operation (5th ed.). Toronto: McGraw-Hill Book Company.

Readability Level (Fry) Grade 8.

Readability level is low, but trigonometry is an integral part of the text.

- Text 2. Krar, S.F., Oswald, J.W., & St. Amand, J.E. (1976). Technology of machine tools. Toronto: McGraw-Hill Ryerson Ltd.

Readability Level (Fry) Grade 12.

Motor Vehicle Repair: (Mechanical)

- Text 1. Crouse, William H. (1980). Automotive mechanics (1st Canadian ed., SI Metric). Toronto: McGraw-Hill Ryerson Ltd.

Readability Level (Fry) Upper Grade 8.

Lots of diagrams. This is a reference book in which to look up specialty methods.

Auto Body Repair:

- Text 1. Duenk, Lester G., Williams, Randolph W., & Brooks, Clarence A. (1977). Auto body repair. Peoria, Illinois: Chas. A. Bennett Co. Inc.

Readability Level (Fry) Upper Grade 12 to college.

Power Engineering:

- Text 1. Embleton, William O.B.E. (1976). Reed's mathematics for engineers (4th ed.). London: Thomas Reed and Company Ltd.

Readability Level (Fry) High Grade 12 to college.

- Text 2. Ticomb, G.R.A. (1979). Fundamentals of engineering science. Revised and metricated by M. Jackson. London: Hutchinson & Co. Publishers Ltd.

Readability Level (Fry) Grade 11-12.

Highly technical, heavy mathematical content, heavy technical vocabulary load.

- Text 3. Correspondence Course--Power Engineering 4th Class Interprovincial Standardized Course for 4th Class Power Engineers. (1981). Prepared by the SAIT Power Engineering Department. Calgary: Southern Alberta Institute of Technology.

Readability Level (Fry) Upper College.

- Text 4. ASME Boiler and Pressure Vessel Code. An American National Standard ANSI/ASME BPV-VII Sect. VII. Recommended Rules for Care of Power Boilers. (1977).

Readability Level (Fry) Upper College.

Welding:

- Text 1. Pender, James A. (1978). Welding (2nd ed., SI Metric). Toronto: McGraw-Hill Ryerson, Ltd.

Readability Level (Fry) top of Grade 11, low Grade 12.

- Text 2. Giachino, Joseph W., & Weeks, William. (1976). Welding skills and practices. Chicago: American Technical Publishers, Inc.

Readability Level (Fry) Grade 7.

Academic Texts:

Note: Academic texts listed in this section were in use at the time of the study, but were being changed. Readability levels were determined in English and Science. The Mathematics text did not lend itself to such analysis.

Mathematics:

- Text 1. Boyce, John G., Margolis, Louis, & Slade, Samuel. (1982). Mathematics for technical and vocational students. Toronto: John Wiley and Sons.

Readability: It was found that mathematics texts have a "language of their own." There are so many diagrams and formulas, that it is difficult to find enough running text to apply the same types of measurement that have been applied to the trades, English and Science materials. It was decided to identify this mathematics text for it is used in several of the training programs, but to exclude it from the present word list compilation. This text is used as the math text for most of the mechanical programs, and Barbering, Beauty Culture, Commercial Cooking, Printing, Sheet Metal and Welding.

English:

- Text 1. Vastone, Kay. (1982). Develop your English skills. Toronto: Copp Clark Pitmas.

Readability, Early Grade 10.

2. Elliot, Madeline, Schachter, Norman, & Clark, Alfred T., Jr. (1983). English the easy way. Toronto: Gage Publishing Ltd.

Readability, Grade 10.

Sciences:

- Text 1. Abraham, Marcus, & Thrower, James R. (1980).
Introduction to Applied Physics. Boston:
 Boston Publishers.

Readability Level (Fry) Grade 8.

Lots of diagrams, charts, photos, sample math problems. Good integration of mathematics, clear definitions.

- Text 2. Module for science course designed for students of
 Barbering and Cosmetology (Sample) based on two
 workbooks already listed:

Pearl C. Ware. (19). Standard Textbook of
Cosmetology. Milady Publishing
 Corporation.

Powitt, A.H. Hair Structure and Chemistry
Simplified. Milady Publishing
 Corporation.

Readability Level of the module (Fry) College
 level.

The sample was included to support the
 assertion that the new teacher-compiled modules
 are direct borrowings from the previously used
 textbooks. In fact, it is simply a matter of
 rearranging the materials into "concept"
 packages.

- Text 3. Module on "Work", taken from Abraham and Thrower
 (see above) has a readability level of
 Grade 8.

APPENDIX B

WORD LISTS FOR 15 VOCATION TRAINING PROGRAMS:
ALPHABETIC LISTINGS AND FREQUENCY LISTINGS

Electrical (Pre-Employment	125
Bricklaying	157
Carpentry and Joinery	173
Sheet Metal	197
Barbering	221
Beauty Culture	237
Commercial Cooking	253
Waiter/Waitress	273
Printing	289
Heavy Equipment Repair	299
Machinist	319
Motor Vehicle Repair (Mechanical)	331
Motor Vehicle Repair (Auto Body)	341
Power Engineering	351
Welding	371

Electrical
